

Course Title	Fundamentals of Intelligence		
Purpose	The <i>Fundamentals of Intelligence</i> course introduces students to the foundational concepts, roles, and practices of intelligence as both a profession and a discipline. It is designed as a soft entry point for those beginning their careers in intelligence or related fields, equipping participants with a clear understanding of what intelligence is, why it matters, and how it functions within organisations and society. It recognises the central purpose of intelligence as a function to support decision making, reduce uncertainty, and enable foresight. By providing practical exposure to different domains, organisational context, and roles, it grounds the student in the lived reality of intelligence practices. Finally, it develops an awareness of the mindset required of intelligence professionals and establishes a shared conceptual vocabulary which will be used across future courses.		
Learning Outcomes	By the end of this course a student should be able to: 1. Understand what intelligence is as a discipline. 2. Understand the purpose of intelligence. 3. Describe different types of intelligence activities. 4. Describe different roles of intelligence professionals. 5. Describe how intelligence is conducted by organisations. 6. Describe the elements of the intelligence cycle. 7. Have a basic understanding of the mindset required of an intelligence professional.		
Target Audience	• New starters to intelligence • Intelligence professionals who have not undertaken formal intelligence training. • Investigators, analysts, and managers who want to learn more about intelligence.		
Course Size	12 Students	Duration	1 Day
Delivery Method	Remote / Hybrid / In Person	Prerequisites	Nil

Course Title	Intelligence Tradecraft		
Outcome / Purpose	Intelligence Tradecraft equips students with the conceptual frameworks and practical tools required to think and operate like intelligence analysts. Where the Fundamentals of Intelligence course introduces the discipline, this course focuses on the application of analytic reasoning to real-world security challenges. The purpose of the course is to bridge the gap between subject-matter expertise and problem-solving tradecraft. Security professionals often hold deep knowledge of threats, technologies, or environments, but may not have been trained in the structured analytic methods that convert knowledge into foresight and actionable judgment. This course closes that gap by providing a cognitive foundation in reasoning, biases and analytic frameworks. It introduces applied tradecraft which participants can apply to their target domain. Finally, it embeds habits like analytic rigour, curiosity and self-awareness that can be applied across a range of problem sets.		
Learning Outcomes	By the end of this course a student should be able to: 1. Explain the Data-Information-Knowledge-Wisdom framework and apply it to intelligence problems. 2. Understand how to use who what where when how why & whither in analysis. 3. Be aware of biases and how to avoid them. 4. Understand the fundamentals of ontology. 5. Build a basic intelligence ontology and use it to capture target knowledge. 6. Understand the different types of reasoning used in analysis. 7. Understand and use words of estimative probability. 8. Communicate uncertainty to decision makers 9. Apply basic structured analytic techniques. 10. Perform hypothesis-led analysis.		
Target Audience	• Intelligence professionals. • Investigators and analysts.		
Course Size	12 Students	Duration	2 Days
Delivery Method	Remote / Hybrid / In Person	Prerequisites	Fundamentals of Intelligence

Course Title	Data-Driven Intelligence Analysis		
Outcome / Purpose	Data-Driven Intelligence Analysis introduces analysts to the theory, tools, and techniques required to work confidently with structured and semi-structured data in support of security analysis. Building on the foundations of analytic tradecraft, the course provides students with the skills to prepare, manipulate, and interpret data, and to apply temporal, spatial, and network perspectives to real-world problems. By the end of the course, participants will not only understand core analytic concepts such as time, space, and networks, but also gain practical experience in applying them through hands-on exercises and a simulated target problem. This combination of technical fluency and analytic application ensures students are prepared to integrate data-driven methods into their ongoing professional practice.		
Learning Outcomes	By the end of this course a student should be able to: 1. Open and handle data. 2. Sort, filter, manipulate, deduplicate, format, and clean basic data. 3. Summarise data. 4. Create pivot tables and visualisations. 5. Structure data for import into analytic tools. 6. Understand time, space, and networks. 7. Perform temporal analysis against a dataset. 8. Understand concepts in geospatial analysis. 9. Perform basic geospatial analysis. 10. Understand the elements of network graphs. 11. Perform basic network analysis. 12. Produce a data-driven intelligence report against a simulated target.		
Target Audience	• Intelligence professionals. • Investigators and analysts.		
Course Size	12 Students	Duration	3 Days
Delivery Method	Remote / Hybrid / In Person	Prerequisites	Analytic Tradecraft for Security Professionals
